NICOLÁS ALEJANDRO BASILIO NAVA

Full-Stack Software Engineer | Java & Python | AWS | Web & Mobile

Morelia, Michoacán, Mexico | basilio.nava.nicolas@gmail.com | +52 443 484 2637 | LinkedIn | Portfolio

PROFILE

I deliver full-stack products from APIs to mobile workflows and production operations. At Kiritek, I build Java/Spring Boot and Python/FastAPI services, AWS event-driven integrations and web interfaces for access and attendance systems, while leading solution design and code review in a three-person squad. The MYFRAC visitor assistant reduced handling time from 4–10 to 1–3 minutes; my recent React reservation work spans roughly four months and uses a separate Python/FastAPI backend.

EXPERIENCE

Full-Stack Developer (Mid) | Kiritek | February 2024 – Present

MYFRAC — Residential access platform

I maintain and extend MYFRAC's Spring Boot REST backend for about 5,000 active users across 11 communities, including its OAuth2 login/token flow and HMAC authentication for IoT scanners. I delivered QR invitations across the existing Java API, a new FastAPI service, a Botmaker conversation and a Flutter scanner, deploying the supporting AWS infrastructure with CDK.

Separately, I built the MYFRAC WhatsApp visitor assistant on Botmaker with LLM-based NLU; it handles about 7,000 automated accesses each month and cut handling time from 4–10 to 1–3 minutes. For gate automation, I built and operate an IoT Core (MQTT) → EventBridge → Lambda → DynamoDB event path. I built reusable FastAPI/Pydantic services with custom validators and Java/Python operational reports. I investigate CloudWatch logs, resolve incidents, review code and mentor teammates as de facto lead of a three-person squad.

Kiricheck — Attendance and payroll workflows

I designed DynamoDB schemas and built Python CRUD services on AWS Lambda for WhatsApp-managed attendance. I implemented bonus and pre-payroll calculations over attendance data, built a FastAPI real-time incident monitor and generated CSV, Excel and PDF payroll reports in Python. I also wrote Playwright end-to-end tests for the administrator frontend.

Private club — Reservations and billing migration

I build a React reservation interface with granular RBAC and capability-based UI authorization, backed by a separate Python/FastAPI service. I wrote Vitest and Playwright tests, designed Terraform infrastructure with infra-team feedback and containerized services with Docker. This ongoing React work spans about four months.

In a separate club workstream, I contributed to a Firebird-to-PostgreSQL billing ETL completed and validated in DEV for about 911,297 charges, including derived financial status.

TECHNICAL SKILLS

Java APIs and security: Spring Boot REST, API contracts/versioning/error handling; Spring Security OAuth2 login/tokens, HMAC scanner authentication

Databases: MySQL (schema design, indexing, query tuning, stored procedures), PostgreSQL; DynamoDB (production NoSQL), MongoDB (familiarity)

Data and reporting: Java/Python CSV, Excel and PDF reports

Frontend and testing: React, JavaScript, RBAC, Vitest, Playwright; JUnit/Mockito

Python and AWS: FastAPI, Pydantic; AWS CDK, Lambda, IoT Core, EventBridge, CloudWatch; Terraform, Docker

Languages: Spanish (native) | English (B2)

EDUCATION AND DEVELOPMENT

B.Sc. in Computer Systems Engineering | Instituto Tecnológico de Morelia | 2024

Master's in Big Data Analytics & Visualization | UNIR México | Academic requirements completed; degree conferral pending administrative processing

Master's in AI-Driven Development | BIG school | In progress, expected 2026

Professional Cloud & AWS Program | Commit Academy | In progress (September 2026 – expected 2027)
